Do I have Two Factor Authentication on ALL my systems?

Two factor Authentication (2FA) is one of the strongest ways to protect yourself from cyber criminals accessing your system/email if they have your password. You have probably already used this when accessing your online banking when you get a unique code texted to you

What is the patching and security status of all my systems?

Operating system and software manufacturers are always releasing patches and updates to fix any vulnerabilities that could enable cyber criminals access to your data. Your IT company should be doing this weekly as part of their service and should be able to report on this monthly

What's the status of my Anti-Virus

It goes without saying that everyone should be using a robust and up to date anti-virus system – Your IT company should be able to show you that all your systems are running the latest virus definitions, that all computers have protection and this should be reported to you on a monthly basis

Do I have Email and Web Filtering?

91% of all cyber attacks come through email. A good IT Support company should be making sure that the majority of these threats are trapped before they get to your email and if they do, that any links are blocked in case people click on them by accident

Please show me a backup report

Backup is the best protection from a ransomware attack should a nasty virus get through. You should be able to see that your data is being backed up daily

Do you offer Cyber Security Awareness training

You and your staff are now the weakest link in your company's protection against a cyber attack – your IT company should be regularly educating you and your staff to ensure they are not the cause of the attack

What do you have in place to protect my credentials and access to my systems?

Most IT companies have access to tens or hundreds of business systems, it's important that you know that they take cyber security seriously because if they are not, then your business is very exposed
